

Single Cell Lithium-Ion Charge Management Controller

Features

- Linear Charge Management Controller for Single Lithium-Ion Cells
- High Accuracy Preset Voltage Regulation: $\pm 1\%$ (max)
- Two Preset Voltage Regulation Options:
 - 4.1V - MCP73826-4.1
 - 4.2V - MCP73826-4.2
- Programmable Charge Current
- Automatic Cell Preconditioning of Deeply Depleted Cells, Minimizing Heat Dissipation During Initial Charge Cycle
- Automatic Power-Down when Input Power Removed
- Temperature Range: -20°C to $+85^{\circ}\text{C}$
- Packaging: 6-Pin SOT-23A

Applications

- Single Cell Lithium-Ion Battery Chargers
- Personal Data Assistants
- Cellular Telephones
- Hand Held Instruments
- Cradle Chargers
- Digital Cameras

Typical Application Circuit

Description

The MCP73826 is a linear charge management controller for use in space-limited, cost sensitive applications. The MCP73826 combines high accuracy constant voltage, controlled current regulation, and cell preconditioning in a space saving 6-pin SOT-23A package. The MCP73826 provides a stand-alone charge management solution.

The MCP73826 charges the battery in three phases: preconditioning, controlled current, and constant voltage. If the battery voltage is below the internal low-voltage threshold, the battery is preconditioned with a foldback current. The preconditioning phase protects the lithium-ion cell and minimizes heat dissipation.

Following the preconditioning phase, the MCP73826 enters the controlled current phase. The MCP73826 allows for design flexibility with a programmable charge current set by an external sense resistor. The charge current is ramped up, based on the cell voltage, from the foldback current to the peak charge current established by the sense resistor. This phase is maintained until the battery reaches the charge-regulation voltage.

Then, the MCP73826 enters the final phase, constant voltage. The accuracy of the voltage regulation is better than $\pm 1\%$ over the entire operating temperature range and supply voltage range. The MCP73826-4.1 is preset to a regulation voltage of 4.1V, while the MCP73826-4.2 is preset to 4.2V.

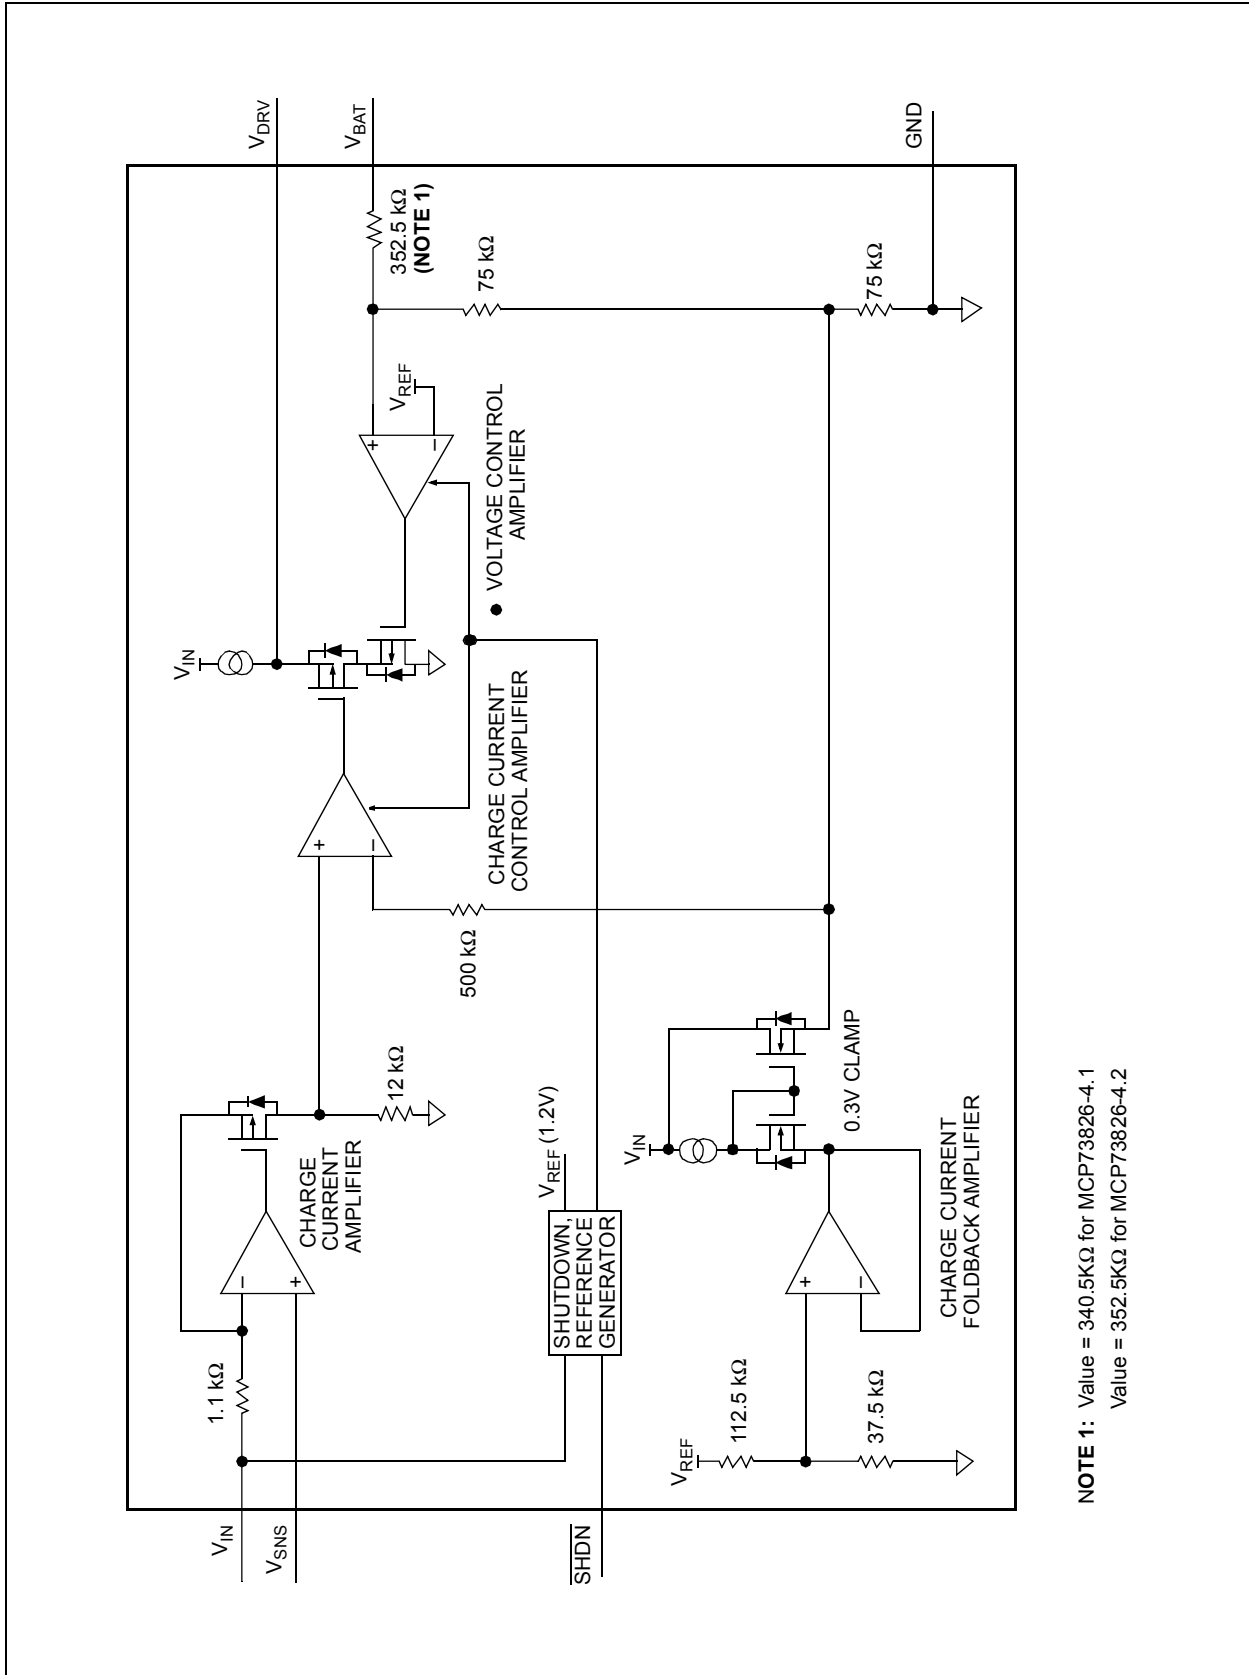

The MCP73826 operates with an input voltage range from 4.5V to 5.5V. The MCP73826 is fully specified over the ambient temperature range of -20°C to $+85^{\circ}\text{C}$.

 Value = $352.5\text{ k}\Omega$ for MCP73826-4.2

1.0 ELECTRICAL CHARACTERISTICS

1.1 Maximum Ratings*

V_{IN} -0.3V to 6.0V

All inputs and outputs w.r.t. GND -0.3 to ($V_{IN}+0.3$)V

Current at V_{DRV} +/-1 mA

Maximum Junction Temperature, T_J 150°C

Storage temperature -65°C to +150°C

ESD protection on all pins ≥ 4 kV

***Notice:** Stresses above those listed under “Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

PIN FUNCTION TABLE

Pin	Name	Description
1	$\overline{\text{SHDN}}$	Logic Shutdown
2	GND	Battery Management 0V Reference

3.0 PIN DESCRIPTION

The descriptions of the pins are listed in Table 3-1.

Pin	Name	Description
1	SHDN	Logic Shutdown
2	GND	Battery Management 0V Reference
3	V _{BAT}	Cell Voltage Monitor Input
4	V _{DRV}	Drive Output
5	V _{IN}	Battery Management Input Supply
6	V _{SNS}	Charge Current Sense Input

TABLE 3-1: Pin Function Table.

3.1 Logic Shutdown (SHDN)

Input to force charge termination, initiate charge, or initiate recharge.

3.2 Battery Management 0V Reference (GND)

Connect to negative terminal of battery.

3.3 Cell Voltage Monitor Input (VBAT)

Voltage sense input. Connect to positive terminal of battery. Bypass to GND with a minimum of 10 μ F to ensure loop stability when the battery is disconnected. A precision internal resistor divider regulates the final voltage on this pin to V_{REG}.

3.4 Drive Output (VDRV)

Direct output drive of an external P-channel MOSFET pass transistor for current and voltage regulation.

3.5 Battery Management Input Supply (VIN)

A supply voltage of 4.5V to 5.5V is recommended. Bypass to GND with a minimum of 10 μ F.

3.6 Charge Current Sense Input (VSNS)

Charge current is sensed via the voltage developed across an external precision sense resistor. The sense resistor must be placed between the supply voltage (V_{IN}) and the source of the external pass transistor. A 50 m Ω sense resistor produces a fast charge current of 1 A, typically.

4.0 DEVICE OVERVIEW

The MCP73826 is a linear charge management controller. Refer to the functional block diagram on page 2 and the typical application circuit, Figure 6-1.

4.1 Charge Qualification and Preconditioning

Upon insertion of a battery or application of an external supply, the MCP73826 verifies the state of the $\overline{\text{SHDN}}$ pin. The $\overline{\text{SHDN}}$ pin must be above the logic high level.

If the $\overline{\text{SHDN}}$ pin is above the logic high level, the MCP73826 initiates a charge cycle. If the cell is below the preconditioning threshold, 2.4V typically, the MCP73826 preconditions the cell with a scaled back current. The preconditioning current is set to approximately 43% of the fast charge peak current. The preconditioning safely replenishes deeply depleted cells and minimizes heat dissipation in the external pass transistor during the initial charge cycle.

4.2 Controlled Current Regulation - Fast Charge

Preconditioning ends and fast charging begins when the cell voltage exceeds the preconditioning threshold. Fast charge utilizes a foldback current scheme based on the voltage at the V_{SNS} input developed by the drop across an external sense resistor, R_{SENSE} , and the output voltage, V_{BAT} . Fast charge continues until the cell voltage reaches the regulation voltage, V_{REG} .

4.3 Constant Voltage Regulation

When the cell voltage reaches the regulation voltage, V_{REG} , constant voltage regulation begins. The MCP73826 monitors the cell voltage at the V_{BAT} pin. This input is tied directly to the positive terminal of the battery. The MCP73826 is offered in two fixed-voltage versions for battery packs with either coke or graphite anodes: 4.1V (MCP73826-4.1) and 4.2V (MCP73826-4.2).

4.4 Charge Cycle Completion

The charge cycle can be terminated by a host microcontroller after an elapsed time from the start of the charge cycle. The charge is terminated by pulling the shutdown pin, $\overline{\text{SHDN}}$, to a logic Low level.

MCP73826

5.0 DETAILED DESCRIPTION

Refer to the typical application circuit, Figure 6-1.

5.1 Analog Circuitry

5.1.1 OUTPUT VOLTAGE INPUT (V_{BAT})

The MCP73826 monitors the cell voltage at the V_{BAT} pin. This input is tied directly to the positive terminal of the battery. The MCP73826 is offered in two fixed-voltage versions for single cells with either coke or graphite anodes: 4.1V (MCP73826-4.1) and 4.2V (MCP73826-4.2).

5.1.2 GATE DRIVE OUTPUT (V_{DRV})

The MCP73826 controls the gate drive to an external P-channel MOSFET, Q1. The P-channel MOSFET is controlled in the linear region, regulating current and voltage supplied to the cell. The drive output is automatically turned off when the input supply falls below the voltage sensed on the V_{BAT} input.

5.1.3 SUPPLY VOLTAGE (V_{IN})

The V_{IN} input is the input supply to the MCP73826. The MCP73826 automatically enters a power-down mode if the voltage on the V_{IN} input falls below the voltage on the V_{BAT} pin. This feature prevents draining the battery pack when the V_{IN} supply is not present.

5.1.4 CURRENT SENSE INPUT (V_{SNS})

Fast charge current regulation is maintained by the voltage drop developed across an external sense resistor, R_{SENSE} , applied to the V_{SNS} input pin. The following formula calculates the value for R_{SENSE} :

$$R_{SENSE} = \frac{V_{CS}}{I_{OUT}}$$

Where:

V_{CS} is the current limit threshold

I_{OUT} is the desired peak fast charge current in amps. The preconditioning current is scaled to approximately 43% of I_{OUT} .

5.2 Digital Circuitry

5.2.1 SHUTDOWN INPUT (\overline{SHDN})

The shutdown input pin, \overline{SHDN} , can be used to terminate a charge anytime during the charge cycle, initiate a charge cycle, or initiate a recharge cycle.

Applying a logic High input signal to the \overline{SHDN} pin, or tying it to the input source, enables the device. Applying a logic Low input signal disables the device and terminates a charge cycle. In shutdown mode, the device's supply current is reduced to 0.5 μ A, typically.

6.0 APPLICATIONS

The MCP73826 is designed to operate in conjunction with a host microcontroller or in stand-alone applications. The MCP73826 provides the preferred charge

algorithm for Lithium-Ion cells, controlled current followed by constant voltage. Figure 6-1 depicts a typical stand-alone application circuit and Figure 6-2 depicts the accompanying charge profile.

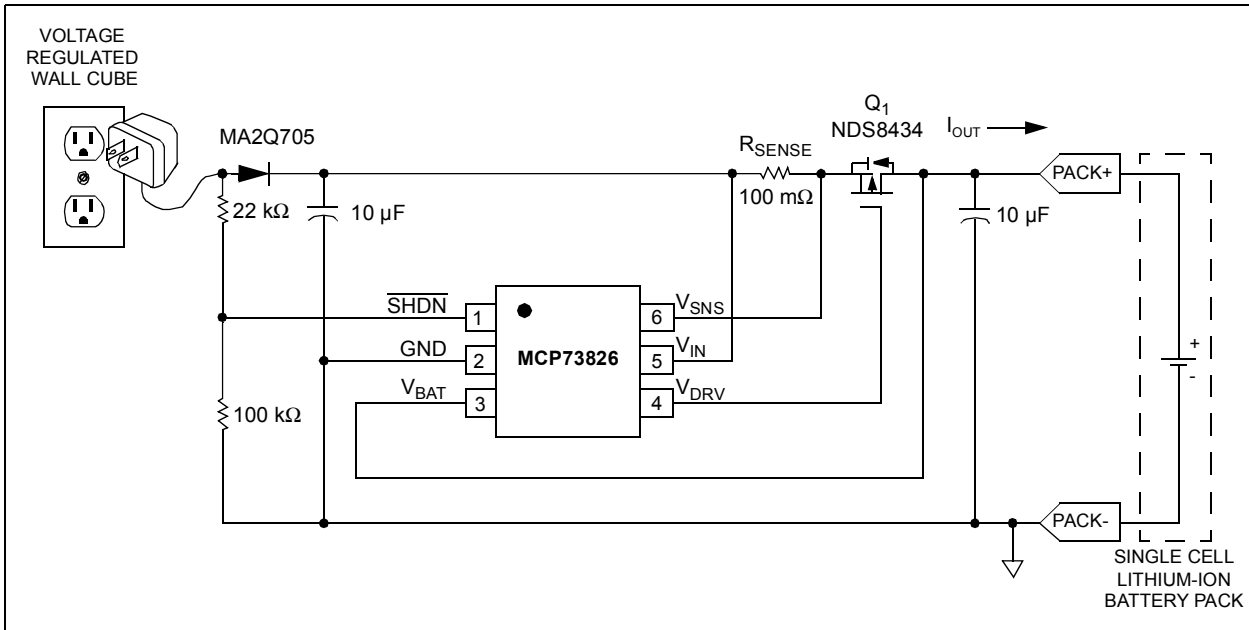

FIGURE 6-1: Typical Application Circuit.

FIGURE 6-2: Typical Charge Profile.

MCP73826

6.1 Application Circuit Design

Due to the low efficiency of linear charging, the most important factors are thermal design and cost, which are a direct function of the input voltage, output current and thermal impedance between the external P-channel pass transistor, Q1, and the ambient cooling air. The worst-case situation is when the output is shorted. In this situation, the P-channel pass transistor has to dissipate the maximum power. A trade-off must be made between the charge current, cost and thermal requirements of the charger.

6.1.1 COMPONENT SELECTION

Selection of the external components in Figure 6-1 is crucial to the integrity and reliability of the charging system. The following discussion is intended as a guide for the component selection process.

6.1.1.1 SENSE RESISTOR

The preferred fast charge current for Lithium-Ion cells is at the 1C rate with an absolute maximum current at the 2C rate. For example, a 500 mAH battery pack has a preferred fast charge current of 500 mA. Charging at this rate provides the shortest charge cycle times without degradation to the battery pack performance or life.

The current sense resistor, R_{SENSE} , is calculated by:

$$R_{SENSE} = \frac{V_{CS}}{I_{OUT}}$$

Where:

V_{CS} is the current limit threshold voltage

I_{OUT} is the desired peak fast charge current

For the 500 mAH battery pack example, a standard value 100 m Ω , 1% resistor provides a typical peak fast charge current of 530 mA and a maximum peak fast charge current of 758 mA. Worst case power dissipation in the sense resistor is:

$$PowerDissipation = 100m\Omega \times 758mA^2 = 57.5mW$$

A Panasonic ERJ-L1WKF100U 100 m Ω , 1%, 1 W resistor is more than sufficient for this application.

A larger value sense resistor will decrease the peak fast charge current and power dissipation in both the sense resistor and external pass transistor, but will increase charge cycle times. Design trade-offs must be considered to minimize space while maintaining the desired performance.

6.1.1.2 EXTERNAL PASS TRANSISTOR

The external P-channel MOSFET is determined by the gate to source threshold voltage, input voltage, output voltage, and peak fast charge current. The selected P-channel MOSFET must satisfy the thermal and electrical design requirements.

Thermal Considerations

The worst case power dissipation in the external pass transistor occurs when the input voltage is at the maximum and the output is shorted. In this case, the power dissipation is:

$$PowerDissipation = V_{INMAX} \times I_{OUT} \times K$$

Where:

V_{INMAX} is the maximum input voltage

I_{OUT} is the maximum peak fast charge current

K is the foldback current scale factor

Power dissipation with a 5V, +/-10% input voltage source, 100 m Ω , 1% sense resistor, and a scale factor of 0.43 is:

$$PowerDissipation = 5.5V \times 758mA \times 0.43 = 1.8W$$

Utilizing a Fairchild NDS8434 or an International Rectifier IRF7404 mounted on a 1in² pad of 2 oz. copper, the junction temperature rise is 90°C, approximately. This would allow for a maximum operating ambient temperature of 60°C.

By increasing the size of the copper pad, a higher ambient temperature can be realized or a lower value sense resistor could be utilized.

Alternatively, different package options can be utilized for more or less power dissipation. Again, design trade-offs should be considered to minimize size while maintaining the desired performance.

Electrical Considerations

The gate to source threshold voltage and $R_{DS(ON)}$ of the external P-channel MOSFET must be considered in the design phase.

The worst case, V_{GS} provided by the controller occurs when the input voltage is at the minimum and the charge current is at the maximum. The worst case, V_{GS} is:

$$V_{GS} = V_{DRVMAX} - (V_{INMIN} - I_{OUT} \times R_{SENSE})$$

Where:

V_{DRVMAX} is the maximum sink voltage at the V_{DRV} output

V_{INMIN} is the minimum input voltage source

I_{OUT} is the maximum peak fast charge current

R_{SENSE} is the sense resistor

Worst case, V_{GS} with a 5V, +/-10% input voltage source, 100 m Ω , 1% sense resistor, and a maximum sink voltage of 1.6V is:

$$V_{GS} = 1.6V - (4.5V - 758mA \times 99m\Omega) = -2.8V$$

At this worst case, V_{GS} , the R_{DSON} of the MOSFET must be low enough as to not impede the performance of the charging system. The maximum allowable R_{DSON} at the worst case V_{GS} is:

$$R_{DSON} = \frac{V_{INMIN} - I_{OUT} \times R_{SENSE} - V_{BATMAX}}{I_{OUT}}$$

$$R_{DSON} = \frac{4.5V - 758mA \times 99m\Omega - 4.242V}{758mA} = 242m\Omega$$

The Fairchild NDS8434 and International Rectifier IRF7404 both satisfy these requirements.

6.1.1.3 EXTERNAL CAPACITORS

The MCP73826 is stable with or without a battery load. In order to maintain good AC stability in the constant voltage mode, a minimum capacitance of 10 μ F is recommended to bypass the V_{BAT} pin to GND. This capacitance provides compensation when there is no battery load. In addition, the battery and interconnections appear inductive at high frequencies. These elements are in the control feedback loop during constant voltage mode. Therefore, the bypass capacitance may be necessary to compensate for the inductive nature of the battery pack.

Virtually any good quality output filter capacitor can be used, independent of the capacitor's minimum ESR (Effective Series Resistance) value. The actual value of the capacitor and its associated ESR depends on the forward trans conductance, g_m , and capacitance of the external pass transistor. A 10 μ F tantalum or aluminum electrolytic capacitor at the output is usually sufficient to ensure stability for up to a 1 A output current.

6.1.1.4 REVERSE BLOCKING PROTECTION

The optional reverse blocking protection diode depicted in Figure 6-1 provides protection from a faulted or shorted input or from a reversed polarity input source. Without the protection diode, a faulted or shorted input would discharge the battery pack through the body diode of the external pass transistor.

If a reverse protection diode is incorporated in the design, it should be chosen to handle the peak fast charge current continuously at the maximum ambient temperature. In addition, the reverse leakage current of the diode should be kept as small as possible.

6.1.1.5 SHUTDOWN INTERFACE

In the stand-alone configuration, the shutdown pin is generally tied to the input voltage. The MCP73826 will automatically enter a low power mode when the input voltage is less than the output voltage reducing the battery drain current to 8 μ A, typically.

By connecting the shutdown pin as depicted in Figure 6-1, the battery drain current may be further reduced. In this application, the battery drain current becomes a function of the reverse leakage current of the reverse protection diode.

6.2 PCB Layout Issues

For optimum voltage regulation, place the battery pack as close as possible to the device's V_{BAT} and GND pins. It is recommended to minimize voltage drops along the high current carrying PCB traces.

If the PCB layout is used as a heatsink, adding many vias around the external pass transistor can help conduct more heat to the back-plane of the PCB, thus reducing the maximum junction temperature.

MCP73826

7.0 PACKAGING INFORMATION

7.1 Package Marking Information

6-Pin SOT-23A (EIAJ SC-74) Device

Part Number	Code
MCP73826-4.1VCH	CN
MCP73826-4.2VCH	CP

Legend:

- 1 Part Number code + temperature range and voltage (two letter code)
- 2 Part Number code + temperature range and voltage (two letter code)
- 3 Year and 2-month period code
- 4 Lot ID number

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line thus limiting the number of available characters for customer specific information.

7.2 Package Dimensions

Component Taping Orientation for 6-Pin SOT-23A (EIAJ SC-74) Devices

Standard Reel Component Orientation
for TR Suffix Device
(Mark Right Side Up)

Carrier Tape, Number of Components Per Reel and Reel Size:

Package	Carrier Width (W)	Pitch (P)	Part Per Full Reel	Reel Size
6-Pin SOT-23A	8 mm	4 mm	3000	7 in.
